

IS YOUR NETWORK SECURE?

Nearly one million new cyber threats are released *each day*. Is your business at risk?

Every single day, businesses like yours are faced with a growing number of threats to your valuable data.

You may feel that your business is secure from malware, viruses, hackers, malicious employees or even physical theft, but if you have never performed a professional Security Risk Assessment on your Network environment, then you cannot be certain that your company data is safe.

These days, hackers are targeting smaller businesses more and more due to easier access (smaller businesses usually have less security measures in place), and because the owners think that they will be overlooked by hackers due to their company size.

A Network Security Assessment, also known as a Security Audit, involves examining your assets such as servers and computers, as well as the practices, procedures, technical controls, personnel, and other resources to assure that you adhere to recognized best practices and IT Security Mandates.

WHAT IS A SECURITY ASSESSMENT?

-External Penetration Test-

Simulated Hacker Attack from outside your business

-Internal Security Audit-

To discover the characteristics of your work environment, including:

- Physical- Infrastructure Analysis
- Logical- Information Analysis
- End-Point- Users & Computer Analysis

-Executive Summary Report-

Our findings are presented and, if necessary, a document for your Cyber Security Insurance Policy is created.

-Presentation of Recommendations-

We will identify & present the steps your company should to take towards security remediation
