

NETWORK DIAGRAM & SERVER INFRASTRUCTURE

Our platform is built on Asterisk – an open-source framework for building communications applications. Our network and servers have been built to the highest level of resilience. We are connected into the UK's only true voice network and our advanced Linux Based Dell server clusters are located across two data centres.

Our main data centre offers industry-leading resilience, benefiting from two separate 33kV supplies, from two independent grid substations. In each cluster we run load balanced controllers and hosts to provide further back-up. We connect to the PSTN using direct SS7.

Our IP traffic flows directly over uncontended links to our peers and we peer extensively over LINX and LonAP as well as privately to ensure that traffic is handed to other ISPs locally wherever possible.
